

A Perfect Fit for Your Metal Roof!

Here's how the Metal Retrofit Roofing System works:

1

The roofing system is applied right over your existing metal deck. No tear-off required.

2

Insulation is cut and placed to fill the flutes.

3

Another insulation layer is added to ensure a flat surface and increase R-value.

4

The prefabricated membrane is mechanically-fastened to the deck over the insulation.

5

Prefabricated flashings for stacks and other penetrations are heat-welded on-site to create a monolithic covering and ensure a leak-proof seal.

- Can be installed over an existing metal roof without an expensive tear-off
- A cost-effective, long-term way to protect buildings against rain, temperature changes, interior drips, ice build-up, and rust/corrosion
- Flexible membrane expands and contracts with the weather, eliminating the risk of rooftop leaks.
